

Why your agent gets caught

CHAPTER 01

A detector scores your exit before a single line of JavaScript runs.
Datacenter ASN, a server TLS fingerprint that contradicts the persona OS,
and a headless control plane are all pre-JS tells.

What follows are the four layers, in the order they are checked:
network, transport, browser surface, behaviour.

Build a profile that holds

CHAPTER 02

A coherent profile tells one story: OS, GPU, fonts, timezone, locale and exit country agree with each other, and keep agreeing tomorrow.

One seed governs every noisy surface, so a profile that passed today answers identically next week.

Run a fleet without linkage

CHAPTER 03

Linkage is a comparison between profiles, not a property of one.
Shared honest values are neutral in a large anonymity set; shared LIES
are what gets a fleet correlated.

Rotate exits per profile, never re-randomise a live profile.

Keep the accounts alive

CHAPTER 04

Warm-up, session cadence and captcha handling decide survival more than any single fingerprint axis.

Measure weekly against named detectors. Keep the raw output, dated.
